

Looks Silver, Acts Green

When you're choosing a wiring method for your "green" building design, remember, steel conduit is your most environmentally-sound choice. Steel is the world's number one recycled material — nearly 80 million tons last year in the U.S. alone.

And once steel conduit is installed, it's reusable. With most other wiring methods, if you need to change or add a circuit, you have to pull the material out, discard it and start over, or you abandon the circuit and start over. With steel conduit, you keep the conduit in place, and simply install new conductors. Thanks to steel conduit's exceptionally long service life, you'll find it still in use after more than 60 years.

Steel conduit contributes to sustainability through waste reduction, resource conservation, and re-usability. It's your best lifetime value.

For more information on how green steel conduit really is, visit us at www.steelconduit.org.
